

Internationale Gewässerschutzkommission für den Bodensee

Bericht Nr. 6

**Untersuchungen zur Feststellung
der Ursachen für die
Verschmutzung des Bodensees**

**Ergebnisse der Reihenuntersuchungen und Erhebungen
im Jahre 1961**

— 1967 —

1. Einleitung

Die Frage nach den Ursachen der Verschmutzung des Bodensees wurde bereits in dem Bericht Nr. 1 der Internationalen Gewässerschutzkommission für den Bodensee allgemein behandelt. Der Bericht läßt erkennen, daß die Veränderungen des Sees in den letzten Jahrzehnten weitgehend auf die unmittelbare und mittelbare Einleitung von ungenügend gereinigten Abwässern zurückzuführen sind.

Um zu weiteren Unterlagen über die Ursachen der Verschmutzung zu kommen, wurden die Sachverständigen der Kommission beauftragt, eingehende Untersuchungen und Erhebungen über Art, Menge und Herkunft der für die Veränderung des Sees maßgeblichen Stoffe anzustellen. Es sollten dabei vor allem die erforderlichen Ausgangswerte für eine Stoffbilanz und für die spätere Beurteilung der Wirksamkeit von Reinhaltemaßnahmen festgestellt werden. Das von den Sachverständigen vorgeschlagene Arbeitsprogramm wurde im Oktober 1960 von der Kommission genehmigt und im Frühjahr 1961 in Angriff genommen.

Im vorliegenden Bericht sind die bis jetzt gefundenen Ergebnisse dieser Untersuchungsarbeiten zusammengestellt und soweit ausgewertet, wie es zum gegenwärtigen Zeitpunkt möglich ist.

2. Arbeitsprogramm

Bei der Aufstellung des Arbeitsprogramms wurde besonderes Gewicht auf die genaue Festlegung von Arbeitsvorschriften gelegt, die in allen Anliegerstaaten einheitlich angewendet werden sollen.

Das Programm sah zunächst zwei Teilaufgaben vor:

1. Physikalisch-chemische Untersuchungen der bedeutenderen natürlichen Bodenseezuflüsse in der Nähe ihrer Mündung und der unmittelbar in den See führenden zusammengefaßten kommunalen Abwassereinleitungen.
2. Feststellung der durch die Untersuchungen nach Ziffer 1 nicht erfaßbaren Abwasserbelastung aus den Seeanliegergemeinden auf dem Wege statistischer Erhebungen.

Die Arbeiten zur Teilaufgabe 1 bestehen aus Untersuchungsfolgen von jeweils drei im Laufe eines Jahres durchzuführenden, gleichartigen Reihenuntersuchungen, die in größeren Zeitabständen stattfinden sollen. Bei der jahreszeitlichen Festlegung der drei Reihenuntersuchungen wurde davon ausgegangen, daß sie bei unterschiedlichen Witterungsbedingungen, aber stets stabilen Abflußverhältnissen vorgenommen werden sollten. Sie wurden auf die Monate Februar/März, Juni und Oktober gelegt und sollen am gesamten Seeufer möglichst gleichzeitig, in jedem Falle aber innerhalb eines Zeitraumes von vier Wochen, stattfinden.

Bei jeder Reihenuntersuchung sind aus den ausgewählten Zuflüssen und Einleitungen 7 Tage lang im Abstand von 4 Stunden Wasserproben zu entnehmen und zu analysieren. An jeder Wasserprobe sind zu bestimmen:

Temperatur
pH-Wert
absetzbare Stoffe
Gesamthärte
Karbonathärte
Sauerstoff
5tägiger biochemischer Sauerstoffbedarf (BSB₅)
Kaliumpermanganat-Verbrauch
Kjeldahl-Stickstoff
Ammonium-Stickstoff
Nitrit-Stickstoff
Nitrat-Stickstoff
Gesamt-Phosphor
Phosphat-Phosphor
Chlorid-Ion

Außerdem sind fallweise zu bestimmen:

Anionaktive Detergentien
Phenole

An allen Entnahmestellen ist zudem in dem untersuchten Fließgewässer oder Kanal der Abfluß zur Zeit jeder Probeentnahme festzustellen.

Zur Erledigung von Teilaufgabe 2 des Arbeitsprogrammes ist es erforderlich, in den in Frage kommenden Seeanliegergemeinden die Einwohnerzahlen und Industrie-Einwohnergleichwerte zu ermitteln. Die in den See gelangenden Mengen an BSB₅, Gesamtstickstoff und Gesamtphosphor sollen sodann durch Multiplikation der Summe von Einwohnern und Industrie-Einwohnergleichwerten mit folgenden Grundwerten gefunden werden:

Biochemischer Sauerstoffbedarf (BSB ₅):	50 g / E,T
Gesamtstickstoff:	12 g / E,T
Gesamtphosphor:	3 g / E,T

Die Sachverständigen der Kommission sind sich bewußt, daß das Ergebnis einer derartigen statistischen Erhebung große Unsicherheiten in sich birgt. Es gibt aber praktisch keine andere Möglichkeit, die Belastung des Sees durch das Abwasser von Seeanliegergemeinden ohne zusammengefaßte kommunale Abwassereinleitungen zu erfassen.

Die Untersuchungen und Erhebungen zu den Teilaufgaben 1 und 2 des Arbeitsprogrammes wurden erstmals im Jahre 1961 durchgeführt. Die Diskussion der Ergebnisse ließ erkennen, daß zur Aufstellung einer Stoffbilanz für den See und zur Beantwortung der Frage nach der Herkunft der eutrophierenden Stoffe eine Erweiterung des Arbeitsprogrammes um folgende Teilaufgaben erforderlich ist:

3. Physikalisch-chemische Untersuchungen des Bodenseeabflusses.
4. Chemische Untersuchungen zur Feststellung der natürlichen Grundwerte des BSB₅, des Gesamtstickstoffs und des Gesamtphosphors.
5. Chemische Untersuchungen über die Herkunft des Phosphors.

3. Methodik

Der durch den Arbeitsumfang bedingte Einsatz mehrerer Untersuchungsinstitute verlangte eine strenge Vereinheitlichung der anzuwendenden Untersuchungsvorschriften. Die einzelnen Methoden für die physikalisch-chemischen Wasseruntersuchungen wurden deshalb genau definiert und schriftlich festgehalten. Nach Abschluß der Vorarbeiten wurden den untersuchenden Instituten verschiedenartige Wasserproben zur vergleichenden Analyse zugestellt. Die Ergebnisse dieser Testanalysen waren zufriedenstellend.

Im einzelnen wurden folgende Methoden vorgeschrieben:

Temperatur

Messung an Ort und Stelle auf 0,1° C genau.

pH-Wert

Messung im Laboratorium mittels geeichter elektrometrischer Arbeitsgeräte.

Absetzbare Stoffe

Messung im Laboratorium mittels Imhoff-Glas und Ablesung des Absetzvolumens nach 2 Stunden.

Sauerstoff

Bestimmung nach Winkler (Deutsche Einheitsverfahren, 3. Aufl. G 2) nach blasenfreier Auffüllung und Fixierung der Proben an Ort und Stelle.

BSB₅

Bei wenig belasteten Vorflutern Bebrütung der blasenfrei abgefüllten Proben in einem auf 20° C thermostatisierten Wasserbad. Wässer mit einem mutmaßlichen Rest-Sauerstoffgehalt von weniger als 3 mg/l werden mit belüftetem, ausgezehrtem Seewasser entsprechend verdünnt. Berechnung nach Heller (Deutsche Einheitsverfahren, 2. Aufl. H 5).

Kaliumpermanganatverbrauch

Bestimmung nach Kubel-Thiemann mit 0,01 n-KMnO₄-Lösung, erforderlichenfalls bei entsprechender Verdünnung der Probe.

Kjeldahl-Stickstoff

Mikro-Kjeldahl-Aufschluß unter Zusatz von Selen-Katalysator und photometrischer (mit Nessler-Reagens) oder titrimetrischer Bestimmung des Ammoniums im Destillat.

Ammonium-Stickstoff

Photometrische Bestimmung mit Nessler-Reagens im vorbehandelten (filtrierten oder geklärten) Probematerial, Ausmessung der Farbtiefe 30 Min. nach Reagenszugabe.

Nitrit-Stickstoff

Bestimmung nach Griess-Ilosvay-Lunge mit Sulfanilsäure und α-Naphtylamin im vorbehandelten Probematerial, photometrische Ausmessung des gebildeten roten Azo-farbstoffes nach 60 Min. Entwicklungszeit.

Nitrat-Stickstoff

Photometrische Bestimmung mit Natriumsalicylat nach Scheringa im vorbehandelten Probematerial.

Gesamt-Stickstoff

Berechnung als Summe von Kjeldahl-Stickstoff und Nitrat-Stickstoff.

Phosphat-Phosphor

Bestimmung nach Wattenberg und Kalle. Reduktion des Molybdän-Komplexes mit Zinn-II-Chlorid im abgesetzten bzw. filtrierten Probematerial.

Gesamt-Phosphor

Bestimmung nach Wattenberg und Kalle nach Mineralisation des organisch gebundenen Phosphors durch Glühen des Abdampfrückstandes des ursprünglichen Probematerials bei 550° C und Hydrolyse der Mineralisationsprodukte unter Zusatz von Salzsäure auf dem Wasserbad.

Chloride

Titration mit Mercurinitrat und Diphenylcarbazon als Endpunktindikator.

Karbonathärte

Titration mit 0,1 n-Salzsäure gegen Methylorange.

Gesamthärte

Titration mit Komplexon und Eriochromschwarz-T als Endpunktindikator.

Anionaktive Detergentien

Methylenblaumethode nach Longwell und Manière, modifiziert.

Phenol

Photometrische Ausmessung des mit Dibromchinonchlorimid gebildeten blauen Farbstoffes, erforderlichenfalls mit vorangehender Konzentration des Probematerials.

Die Standardlösungen für die photometrischen Messungen, der Standardpuffer, die zur Einstellung der Thiosulfatlösung definierte Bichromatlösung, eine definierte organische P-Verbindung und eine definierte anionaktive Testsubstanz wurden den beteiligten Instituten durch die Eidg. Anstalt für Wasserversorgung, Abwasserreinigung und Gewässerschutz an der ETH Zürich zur Verfügung gestellt.

4. Durchführung

Die 1. Folge von drei Reihenuntersuchungen nach Teilaufgabe 1 des Arbeitsprogrammes wurde im Jahre 1961 durchgeführt. Dabei wurden den folgenden Zuflüssen und Einleitungen Wasserproben entnommen und analysiert:

Am baden-württembergischen Seeufer

durch das Regierungspräsidium Südbaden

Radolfzeller Aach

durch das Staatl. Institut für Seenforschung und Seenbewirtschaftung in Langenargen

Stockacher Aach

Rotach

Seefelder Aach

Schussen

Lipbach

Argen

Am bayerischen Seeufer

durch das Bayer. Landesamt für Wasserversorgung und Gewässerschutz und den Sachverständigen für die chemisch-biologische Gewässerüberwachung bei der Regierung der Oberpfalz

Lindauer Aach

Ablauf der Sammelkläranlage Lindau

Leiblach

Am österreichischen Seeufer

durch die Chemische Versuchsanstalt des Landes Vorarlberg

Leiblach

Dornbirner Ach

Leiblach-Kanal

Lustenauer Kanal

Bregenzer Ach

Alpenrhein

Am schweizerischen Seeufer

durch das Kantonale Laboratorium St. Gallen

Alter Rhein

Steinach

Goldach

Salmsacher Aach

Die 19 Probeentnahmestellen sind im Übersichtsplan (Anl. 1) eingetragen. Die Abflußmeßstellen sind dort ebenfalls angegeben. Soweit für die Abflußmessung keine amtlichen Pegel zur Verfügung standen, mußten Hilfspiegel eingerichtet werden. Die Wasserführung der untersuchten Fließgewässer beträgt zusammen rd. 97% des Gesamtaufwandes zum Bodensee. Die Probeentnahmestellen und Ergebnisse der physikalischen und chemischen Einzelbestimmungen sind ebenso wie die gemessenen Abflußwerte in den Tabellen 1–60 zusammengestellt. Insgesamt wurden bei den Reihenuntersuchungen an 2550 Wasserproben 34 500 Einzelbestimmungen vorgenommen.

Im Laufe des Jahres 1961 haben auch erstmals die Erhebungen nach Teilaufgabe 2 programmgemäß in 71 Seegemeinden stattgefunden.

5. Auswertung

Die Auswertung beschränkte sich vorerst auf die Beantwortung der Fragen nach Art und Menge der in den See gelangenden und für seine Veränderung maßgebenden Stoffe. Dabei wurden aus den Untersuchungsergebnissen zu den Teilaufgaben 1 und 2 zunächst nur die Jahresfrachten an BSB₅, Gesamtphosphor und Gesamtstickstoff ermittelt. Eine weitergehende Auswertung, insbesondere zur Klärung der Frage nach der Herkunft der Stoffe, ist erst dann möglich, wenn die Untersuchungen zu den Teilaufgaben 3, 4 und 5 abgeschlossen sind.

Die Auswertung begann damit, daß in den Tabellen 1–60 für jede Probeentnahme das mit 3,6 vervielfachte Produkt aus Stoffkonzentration (mg/l) und Abflusswert (m³/s) gebildet wurde. Es gibt die Stoffmenge an, die zur Zeit der Probeentnahme innerhalb einer Stunde an der Untersuchungsstelle durch den Flußquerschnitt abgeführt worden ist (Stundenfracht in kg/h). Für diejenigen Untersuchungsstellen, an denen deutliche tageszeitliche Schwankungen der gemessenen Stoffkonzentrationen zu beobachten waren, wurde jede Stundenfracht in Abhängigkeit von der Uhrzeit der Probeentnahme in ein Diagramm eingetragen und sodann eine gemittelte Stoffmengenganglinie gebildet. Die von dieser Linie und den Koordinaten umschlossene Fläche entspricht der Stoffmenge, die während der betreffenden 7-tägigen Reihenuntersuchung im Durchschnitt an einem Tage in den See gelangt ist (Tagesfracht). Durch Multiplikation des arithm. Mittelwertes aus den drei so gefundenen Tagesfrachten mit 365 wurde die Jahresfracht des betreffenden Stoffes bestimmt. Für die Probeentnahmestellen ohne erkennbare tageszeitliche Konzentrationsschwankungen wurde die Tagesfracht aus dem arithmetischen Mittel aller Stundenfrachtwerte gefunden und dann im gleichen Sinne verfahren.

Die auf diese Weise gefundenen Jahresfrachten der untersuchten Zuflüsse und Einleitungen sind zusammen mit den statistisch ermittelten Jahresfrachten von den Seeanliegergemeinden in Tabelle 61 angegeben. Durch Addition dieser Werte ergeben sich nachstehende jährlich in den See gelangende Stoffmengen.

	BSB ₅	Gesamt-stickstoff	Gesamt-phosphor
von den phys.-chem. untersuchten Zuflüssen und Einleitungen	27 394 t	15 229 t	1 351 t
von den statistisch erfaßten Seeanliegergemeinden	7 631 t	1 688 t	403 t
	35 025 t	16 917 t	1 754 t

Die Jahresfrachtwerte für die physikalisch-chemisch untersuchten Zuflüsse und Einleitungen enthalten auch die Stoffmengen im Ablauf der Kläranlage Lindau (vergl. Tabelle 61). Werden diese den statistisch erfaßten Seeanliegergemeinden zugerechnet, dann ergibt sich nachstehende Verteilung der Jahresfrachten auf die Zuflüsse und Seeanliegergemeinden:

	BSB ₅	Gesamt-stickstoff	Gesamt-phosphor
physik.-chem. untersuchte Zuflüsse	77%	90%	76%
statistisch erfaßte Seeanliegergemeinden			
zuzügl. Ablauf der Kläranlage Lindau	23%	10%	24%

Der Anteil der einzelnen Zuflüsse an der Gesamtbelaistung des Sees ist aus Tabelle 61 ersichtlich.
